What is Monkeypox?

Several countries mainly in European and North American regions where monkeypox is non-endemic have reported cases since May 2022.

What is Monkeypox?

- Monkeypox is a disease caused by the virus.
- Basic symptoms are fever, rash and swollen lymph nodes. Symptoms usually last for several weeks and heal without specific treatments.
- The symptoms appear similar to other rash causing diseases such as chicken pox.

What are the symptoms?

- Observe rashes or blisters, regardless of your body part, especially the face, mouth, hands, feet, anus, genitals and buttocks.
- Fever and headache can also be a sign of infection.

How does monkeypox spread?

• Monkeypox mainly spread through: a) contact with infected skin lesions, body fluids or blood (including sexual contact), b) close contact with patients and prolonged exposure to droplets, c) contact with bedding used by patients.

If I have symptoms?

- Consult the nearby clinic.
- When you visit the clinic, cover your rash with gauze or clothing, and wear a mask.
